(54) Title: INJECTION SYRINGE

(57) Abstract: An injection syringe with retractable injection needle has a liquid container with a needle opening, as well as a plunger/plunger rod assembly which is moveable over a travel in the liquid container. Furthermore, an injection needle is provided, which in an active position projects out of the liquid container through the needle opening and in a retracted position is located fully within the liquid container. The injection syringe has a travel limiter which is activated after an injection has been administered using the injection syringe and subsequently the injection needle with needle mount has been moved into the retracted position by the plunger/plunger rod assembly being retracted, after which it restricts the plunger/plunger rod assembly in the event of a movement towards the needle opening, in such a manner that the injection needle cannot be forced out of the liquid container.
